CCTV & Access Control Systems

We watch & listen while you stay secure

Do you need to secure your business, your people and your assets with an electronic security solution? At Teljoy Audio Visual, we offer state-of-the-art security systems to suit your individual business security requirements – whether you need basic surveillance or full-colour audiovisual monitoring and control.

We offer three main services for your electronic security solution:

1. CCTV cameras

When it comes to CCTV cameras, the quality of the camera lens and the CCD sensor is the most important factor, as this provides the clarity of picture which is in turn required for easy recognition and identification purposes.

We offer a wide variety of CCTV cameras:

- Day cameras give you surveillance in areas that remain well lit all the time
- Day/Night cameras provide 24-hour clarity despite any changes in light
- PTZ cameras allow you to Pan, Tilt and Zoom
- HD cameras provide High Definition video fidelity and extreme zoom capabilities.

CCTV cameras can use analogue or digital transmission paths over coaxial and CAT copper cable, as well as fibre optic and lesser-used wireless infrastructure.

Depending on your needs as a business, we also supply CCTV cameras that have face recognition and motion detection abilities, as well as zoom capabilities on recorded footage.

2. Access control systems

Barricade doors, mantraps and turnstiles are worthless without the correct access control equipment to accompany it. From simple systems to advanced biometric systems with full cabling and integration

CCTV & Access Control Systems

Log in and log out procedures give you electromagnetic lock inflow and outflow control and include cards, RFIDs (Tokens or Tags) as well as key code mechanisms. On the other side of the spectrum, biometrics systems include advanced fingerprint, facial, retinal and voice recognition mechanisms.

Functionality can extend to integration with Central and Building management systems.

Functionality can extend to integration with Central and Building management systems.

3. Recording equipment

While CCTV cameras provide surveillance, our range of recording equipment give your business additional security measures that include monitoring, event recording and security management.

Within our recording equipment range, our Digital Video Recorders (DVRs) can record both video and audio feeds in full colour on a hard drive. These DVR devices can store one to two months of footage with 8, 16 or 32 port options depending on required frame rates. Remote access software and licences for off-site monitoring can be included to further extend the functionality of the systems.

In order to prevent bandwidth wastage, our cameras can be activated with motion sensors, and software can be implemented to allow for send alerts to authorised personnel or security. We offer both standalone systems for small business enterprises, and centralised linked systems for large business enterprises as found in the banking, retail, mining and transportation sectors.
